

ABSTRACT

The present invention is a multi-purpose recreational blanket that serves as a lying pad and a means to store and transport desirable and necessary recreational items. The present invention comprises a multi-purpose blanket having an underside that may be dragged across the sand, and a lying pad. The lying pad may further comprise a pillow holder and optional blowup pillow device. The area in-between the underside and lying pad of the present invention forms a storage unit. One or more compartments are housed therein such that desirable items including clothing, shoes, coolers and like items may be conveniently and securely stored and transported. In one preferred embodiment, mesh or transparent material is used for the lying pad allowing stored items to be seen, and therefore easily accounted for and accessed. Velcro, or other desirable connection devices, partially surrounds the periphery of the lying pad and the storage compartment. The present invention may be dragged across sand or similar surfaces, with contents in tow, by virtue of one or more positioned straps. The present invention may be easily stored or transported by tying it together by its straps, or inserting it in a carry bag. One or more geometrically positioned handles may be used by one, or more, people in order to most efficiently transport the blanket and its contents.
